IMPORTANT!

- Before starting any DDOS attack, you need to connect a VPN, which will need to be changed periodically!
- Try to use the most effective way to attack (see "Attack: the most effective way" section)
- Do not attack targets on your own! Follow the Telegram channels that are attacking other targets and just join in the coordinated attack. In this way we have better chances to bring down enemy sites.
- Please use Google translate or if needed
- Glory to Ukraine!
- Russian warship, go f*ck yourself! Down with Putin's War Machine!

How do I connect a VPN?

The easiest and most effective way to connect using a VPN is to use ready-made programs available on internet. Some of them have special promotion code or promo code for those who support Ukraine. Once downloaded and installed, you change your virtual location (your IP) with one click.

If you know of other ways to change your real IP address, or manually set up a VPN, you can use them.

The following is a list of VPN applications and their website links.

Just download and install, then choose a country: in some cases it is preferable to use a Russian VPN location (IP-addresses), in other cases, choose a European or American VPN location. It all depends on the job.

I advise you to download 2-3 VPN applications, because sometimes one of the applications can have connection issues, such as low speed.

Attention! At this moment, as the best choice, I advise you to use Hotspot Shield as the primary VPN app to change your IP address.

Use the internet links below to download and install the applications.

1. Hotspot Shield

Currently there is a promotion code for those who support Ukraine: included in the Premium subscription for one month. Just register and download the program. If the promotion is no longer valid, you can use 7-day free trial period. Just choose the Premium plan, subscribe for 1 month, and cancel before the end of 7-day free trial period.

+	-
Usable interface	
One month premium	
Has Russian IPs	
Lag-free	

2. F-Secure Freedome

The Freedome program is now available for free for those who support Ukraine for 30 days.

+	-
Usable interface	Without Russian IPs
No credit card required	
Lag-free	

3. Urban VPN

It is completely free and very simple to setup.

+	-
Usable interface	Can be laggy
Entire free	Russian IPs work badly most of time
Has Russian IPs	

4. ClearVPN

There is a promo code with six months of free access: SAVEUKRAINE

Because of this, most Ukrainians began to use it and it may have some lag issues. I advise you to use other programs.

+	-
Usable interface	Can be very laggy
Has promocode for free access	Russian IPs doesn't work

5. Windscribe

Paid, but you can find better free ones. I do not recommend.

+	-
Usable interface	Paid
	Can be very laggy
	Russian IPs doesn't work

6. VPN Unlimited (a Keepsolid product)

Similar to ClearVPN, they have a promo code for Ukrainians with a six-month subscription: StopRussianAggression

Go to the Keepsolid login page and click on "Sign up". Log in, and press the Redeem button to activate the promo code.

+	-

Usable interface	Without Russian IPs
Has promocode for free access	Can be very laggy

How to check if your IP address has changed

Important! After you set up and run the VPN, you need to check whether your address has really changed (there are cases when the service was buggy or changes the address to the wrong country that you chose).

Here are the links to check your current IP location:

- Link 1
- Link 2
- Link 3

Attack: mega simple level

For those who want an easy way to help, there is a websites' list and applications that can simply be opened and they will carry out attacks on certain Russian websites.

Important! Don't forget the enabled VPN, which you need to change from time to time, or Tor Browser, which you need to reopen periodically!

The easiest way to do this is to use Tor Browser. After downloading, open the tab with the sites listed below and enjoy the attacks on Russian sites. Each time you log in to the browser, your IP will change. There is also a version of Tor Browser for smartphones - you can open sites from the list below on your smartphone! Attention! Do not use Tor Browser for the below items 4 and 5 since it works only for websites.

Some browsers may recognize these sites as malicious because it is designed to attack (Putin's propaganda) sites. Most of the browsers allows you to accept the risk and continue.

1. павутина.укр

   Attacks a certain list of Russian sites, which is periodically changed.

   Attention! Be careful when opening this site on your laptop or computer because it may be slow.

   Important! Don't forget the enabled VPN, which you need to change from time to time, or Tor Browser, which you need to reopen periodically!

2. http://www.lookquizru.xyz/

   Attacks one of the sites that is relevant at the moment (the site to be attacked is changing dynamically).

   The service was developed by the KiberBULL team. Links to their Telegram channel.

   Important! Don't forget the enabled VPN, which you need to change from time to time, or Tor Browser, which you need to reopen periodically!

3. https://2022pollquizinru.xyz/

   Attacks a certain list of Russian sites.

Another service developed by the KiberBULL team. The link to their Telegram channel.

Attention! Be careful when opening this site on your laptop or computer because it may be slow.

Important! Don't forget the enabled VPN, which you need to change from time to time, or Tor Browser, which you need to reopen periodically!

4. https://help-ukraine-win.com.ua

Attacks a list of sites that changes dynamically on their own, using a proxy. All you need to do is install and run the application.

The program was developed by UA Cyber SHIELD team. Follow the instruction on the link above. This is the link to their Telegram channel.

Important! Don't forget the enabled VPN, which you need to change from time to time, or use Tor Browser, which you need to reopen periodically!

5. DB100N

Attacks a certain list of sites, which is dynamically changing. Made by "DDOS по країні СЕПАРІВ (Кібер-Козаки)" Ukrainian team. This is the Telegram group link. Just follow the instructions, install the app and open it on your computer. Important! Don't forget the enabled VPN.

6. https://playforukraine.org/

A 2048 game that can be run in a browser, and every move you take attacks one of the Russian sites. Sometimes down.

Important! Don't forget the enabled VPN, which you need to change from time to time, or Tor Browser, which you need to reopen periodically!

7. https://stop-russian-propaganda.pp.ua/

Attacks a certain list of Russian sites.

Attention! Be careful when opening this site on your laptop or computer because it may become slow.

Important! Don't forget the enabled VPN, which you need to change from time to time, or Tor Browser, which you need to reopen periodically!

8. https://ban-dera.com/
   Attacks a certain list of Russian sites.

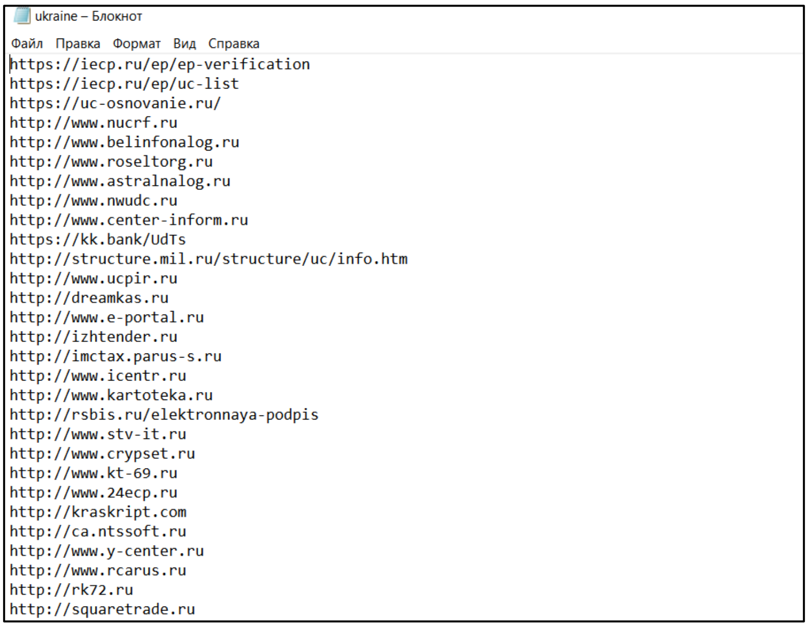
Attention! Be careful when opening this site on your laptop or computer because it may become slow.

Important! Don't forget the enabled VPN, which you need to change from time to time, or Tor Browser, which you need to reopen periodically!

Attack: simple level

If you want to customize your targets for attack, you can use the following solution.

1. Hello World
    - Click on the link above or paste this one in your browser: https://www.dropbox.com/sh/do9hdg0vw3ejfa4/AAD27IeqfyMcRZdWWPDNJbpqa?dl=0
    - Click on Download and then unzip it to the any folder.
    - Go inside the folder and edit the “ukraine.txt” file with websites you want to attack (each site on a new line, example in the screen below).



```

loading http://www.nucrf.ru
```

- If you have Linux or MacOS do the following:
  - go to SystemPreference -> Security & Privacy -> Privacy -> Developer Tool -> Enable Terminal
  - open the Terminal inside the folder, where the file “pray_ukraine_mac” is located.
  - run next commands:
    - chmod +x pray_ukraine_mac
    - sudo ./pray_ukraine_mac
  - enjoy the collapse of the Russian Federation 😉

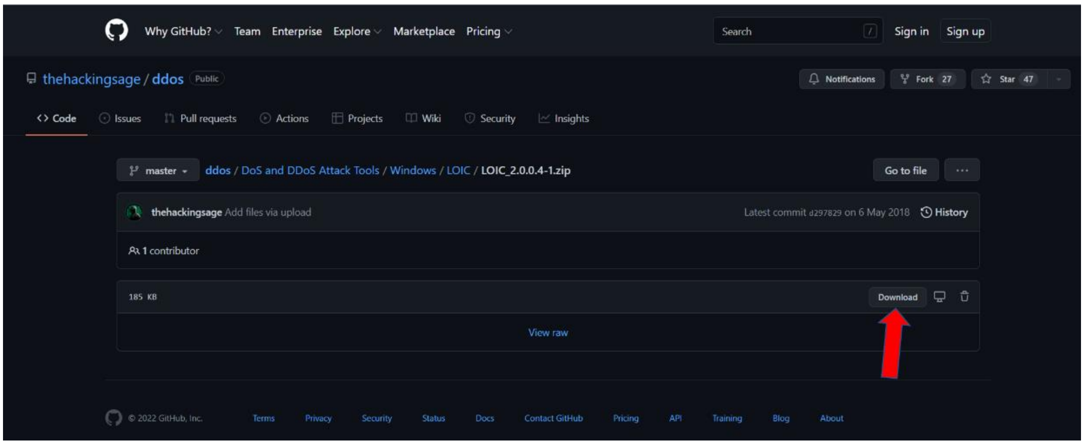
The program was developed by the “Поганці (Fire show)” team. Telegram channel.

Important! Don't forget the enabled VPN, which you need to change from time to time.

2. LOIC

Attention! For Windows users only!

- Use this link to download this program.



thehackingsage / ddos Public

master ddos / DoS and DDoS Attack Tools / Windows / LOIC / LOIC_2.0.0.4-1.zip

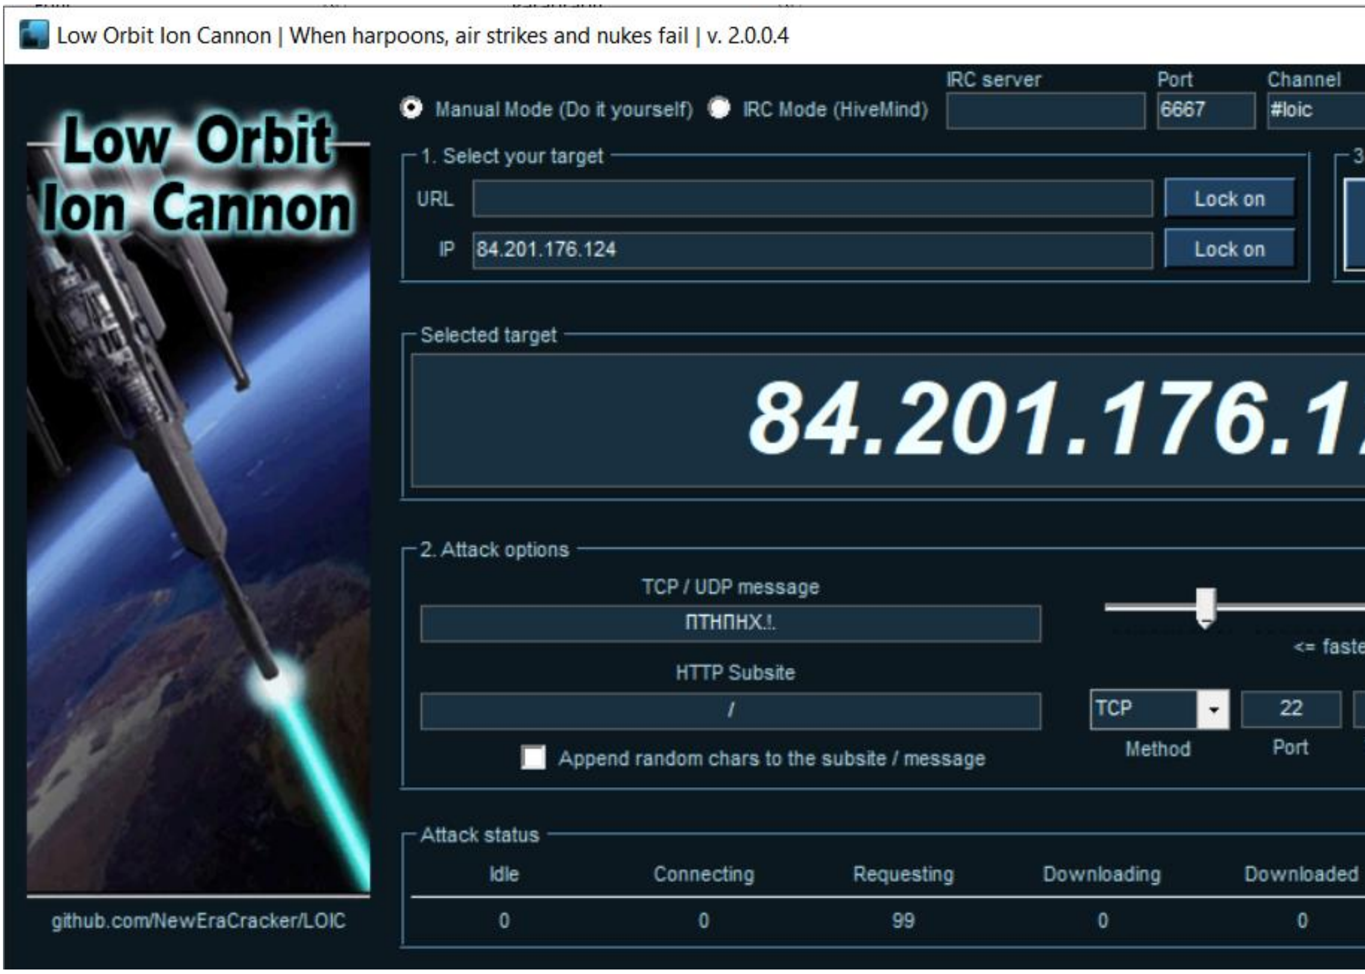
- It may be that your computer may block the download of this archive, so you can disable the antivirus (at your own risk!) while downloading and installing this program. Then after installation, be sure to enable antivirus again.
- Unzip the archive to any folder.
- Run LOIC.exe from this folder



Low Orbit Ion Cannon | When harpoons, air strikes and nukes fail | v. 2.0.0.4

● Manual Mode (Do it yourself) ○ IRC Mode (HiveMind)

IRC server: — Port: 6667 — Channel: #loic

1. Select your target

URL:

IP: 84.201.176.124

Selected target: 84.201.176.1

2. Attack options

TCP / UDP message: ПТНПНХ.!.

HTTP Subsite: /

□ Append random chars to the subsite / message

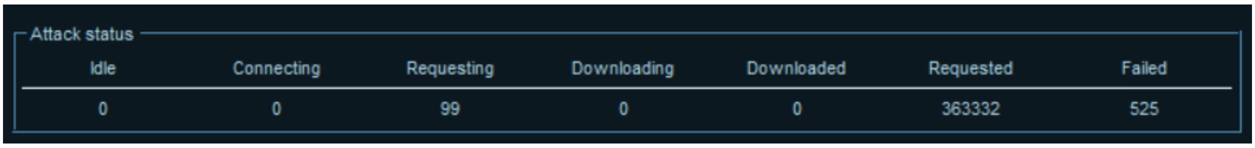
Method: TCP — Port: 22

Attack status

Idle	Connecting	Requesting	Downloading	Downloaded
0	0	99	0	0

- Put in the IP or URL address of the website you want to attack (for example: https://interfax.ru/) and press “Lock on” (as shown in the screen above).

- In the TCP / UDP message field, add any message you want to send to Russia 😉. It is recommended that you change it each time you change your IP address.
- Set the “Speed” slider to the left side or a little more to the right (as shown in the screen above).
- Next, select Method (TCP, HTTP or UDP). In most Telegram channels that publish some targets for the attack, a specific method is already specified, then you can just choose it.
- Next, choose the port in “Port” field (near “Method” field). For example, in next IP: “84.201.176.124:22” port is “22”. In most Telegram channels that publish targets for the attack, the specific port is already specified. Just choose it.
- Important! If “Method” and “Port” are not specified, try standard ports and methods for sites. For example, TCP and 443, TCP and 22, HTTP and 80, other options are possible.
- In the “Threads” field, select the maximum possible number that your computer allows without having issues. Start with 200, then 100 and so on. In my case, it's 99.
- All other fields are left unchanged.
- Press the IMMA CHARGIN MAH LAZER and enjoy the collapse of the Russian Federation 😉.
- How to check if everything works? If the number of “Requested” and “Failed” is greatly increased then you are doing everything right, so keep it up.



Attack status

Idle	Connecting	Requesting	Downloading	Downloaded	Requested	Failed
0	0	99	0	0	363332	525

Important! Don't forget the enabled VPN, which you need to change from time to time.

Attack: intermediate level

For those who understand how to install and run Docker, there are many ready-to-attack scripts that are easy to run from a local or virtual machine.

See this channel or this channel in Telegram for Docker, Python scripts and manuals. See pinned messages firstly in these channels.

Important! Before you run commands to attack a resource, you can check the availability of that resource with the following commands:

- curl http://213.24.76.25:1935/tcp -I (by IP)
- curl https://scr.online.sberbank.ru/api/fl/idgib-w-3ds -I (by URL)

Important! Don't forget the enabled VPN, which you need to change from time to time.

Attack: advanced level

With the Docker, Docker Containers and other scripts you can deploy many virtual machines on special Cloud services where you can run many DDoS attacks.

Tutorials about deployment machines for this on Cloud services:

- DDOS on Azure (EN)
- DDOS on Azure 2 (UA)
- DDOS on Azure 2 (EN Google translated)
- DDOS on AWS (UA)
- DDOS on AWS (EN Google translated)
- DDOS on AWS 2 (UA)
- DDOS on AWS 2 (EN Google translated)
- DDOS on AWS (videos) (UA)
- DDOS on Digital Ocean (UA)
- DDOS on Digital Ocean (EN Google translated)
- DDOS on Digital Ocean 2 (UA)
- DDOS on Digital Ocean 2 (EN Google translated)
- DDOS on Google Cloud (UA)
- DDOS on Google Cloud (EN Google translated)
- DDOS on Google Cloud (video) (UA)

Attack: the most effective way

The “DDOS Tutorial for all” team has written two awesome guides to help you effectively attack the enemy sites. I advise you to read these guides to setup the environment and use the MHDDoS_proxy script. For now it is in Ukrainian and EN Google translated:

- Як розгортати віртуальні машини на Digital Ocean (UA)
- How to deploy virtual machines on Digital Ocean (EN Google translated)
- Детальний розбір MHDDoS_proxy (UA)
- Detailed analysis of MHDDoS_proxy (EN Google translated)

If you have any questions, do not hesitate to ask in Telegram channel.

For more manuals, see GitHub repo:

- GitHub repo

Check the result of DDOS attacks

Everyone who attacks likes to monitor the progress of their attacks and its effectiveness.

Below are two services where you can enter URL or IP of the site (for example, https://interfax.ru/ or 84.201.176.124:22).

- https://port.ping.pe
- https://check-host.net/check-http

There is also a site where you can check the IP address to find all the necessary information about this same IP address, such as: open ports (see Port Scanner), or whether the site is pinged or not:

- https://viewdns.info/

Attention! Also there are useful guides (in Ukrainian and EN Google translated) about how to prepare for DDoS attacks:

- Розвідка для DDOS-атак (UA)
- DDoS Attack Preparation Breakdown (EN Google translated)
- Розвідка для DDOS-атак 2 (UA)
- Target Intelligence 2.0 (EN Google translated)

Afterword

- You can ask any question in this Telegram channel, or post it as a ‘Reply’ in any discussion thread.
- Follow updates on GitHub repo, more content coming soon.
- I would be very grateful for both the distribution of the link to the Telegram “DDOS Tutorial for all” channel (https://t.me/ddos_for_all) and for distributing this tutorial!

Attention!

- You choose whether to carry out attacks on Russian sites or not!
- Use everything in this manual at your own risk!
- Glory to Ukraine!
- Russian warship, go f*ck yourself! Down with Putin’s War Machine!
